This is a sample website for testing PayPal Express Checkout API.

Its front end is built by using HTML5, CSS3, JavaScript(jQuery), and Bootstrap.

Its back end is built by using PHP.

For convenience, the website only have one item and the quantity can only be chosen 1, 2 or 3.

After you press the "place order" button, it will proceed the order to paypal sandbox. Then login with a buyer account and continue to complete the transaction.

During a transaction, a user can choose to either cancel the transaction or continue the transaction.

If a user cancel the transaction, it will display the cancelling information and redirect to homepage after 3 seconds; if a user complete a transaction successfully, it will display the successful message and redirect to homepage after 3 seconds.
